

Examination Statistics
Prof. Dr. Andersson, Prof. Dr. Falkenberg
Course of Study: Computer Sciences
14.2.2017

Name : _____
Matriculation Number : _____

I hereby confirm that I am physically fit to take the examination.

Signature student _____

Problems	1	2	3	4	5	Sum	Mark
Max. scores	22	15	15	15	15	82	
Obt. scores							

Authorized examinations aids:

Scientific calculator, one english-german dictionary, one file folder

Further instructions:

1. Do not use your own paper. Blank paper is attached to this question paper. Extra sheets will be provided on demand.
2. Please notice, not only the solution but the derivation of the solution has to be given.
3. Switch off all electronic devices und remove them from the table.

Good Luck!

Dr. Andersson, Dr. Falkenberg

1. The following data gives the yearly income, the sizes of shoes and the gender for sample of persons in Germany.

size	income	gender
37	32000	w
36	33000	w
38	34000	w
40	34500	w
37	35500	w
37	37000	w
39	37500	w
38	39500	w
41	40500	m
38	42500	w
41	42500	m
39	43000	w
36	44000	w
43	44000	m
42	46000	m
44	46000	m
45	47000	m
41	48000	m
43	48000	m
42	53000	m

- (a) Calculate the mean, the standard deviation, the first quartil, the median, the third quartil of the variable income.
- (b) Draw a boxplot for the variable income.
- (c) Calculate the covariance und the coefficient of correlation of the variables size and income.
- (d) Calculate the parameters of the regression line $\text{income} = a + b \cdot \text{size}$.
Give an interpretation of the values of a and b.
- (e) What do you think about the relationship between the variables size and income? Consider the coefficients of correlation between the variables size and income regarding the variable gender.

2. A man has a bunch of keys with 10 keys. One method of the man to find the right key of the front door of his appartement is method A: he chooses randomly one key out of the bunch of keys and tries it. If the key does not match to the lock, he chooses another key randomly out of the remaining keys. No key will be used two times. The other method B of the man is to choose randomly one key out of the bunch of keys, if the key does not match to the lock he chooses again randomly a key out of the bunch of keys. It can happen that a key is used several times.
- (a) Let X be the random variable which counts the number of trials to open the front door until he enters his appartement. Find the density function of X if the man uses method A resp. method B.
 - (b) If the man arrives at his appartement at the end of a working day he only makes at most 5 trials. If all trials fail he goes to the next pub. The man uses method B if he has already drunk some beers with his colleagues and otherwise method A. The probability that the man drinks some beers with his colleagues is $1/3$.
 - i. Find the probability that man goes to the next pub.
 - ii. The bar keeper of the pub guesses that the man is already drunken when the man enters the pub so early. Find the probability that the bar keeper guesses right.

3. On a highway is a speed limit of 120 km per hour. The speeds of the cars are independently and normally distributed with mean 115 km per hour and standard deviation of 10 km per hour. A radar speed check is controlling the speed of the cars. A driver obtains a ticket if the radar speed check measures a speed higher than 130 km per hour.
- (a) Find the probability that a driver will get a ticket.
 - (b) If 1000 cars per hours pass the radar speed check and the random variable X counts the number of tickets per hours, what is the distribution, the expected value and the variance of X ?
 - (c) Find a suitable distribution which approximates the distribution of X .
 - (d) Calculate the probability that in one hour more than 100 drivers are ticketed with this distribution.
 - (e) Calculate an upper bound for the number of tickets per hour which will be hold with a probability of 0.9.

4. Suppose that an accounting firm does a study to conduct the time needed to complete one person's tax forms. It randomly surveys 101 people. The sample average is 23.6 hours. There is a known standard deviation of 7.0 hours. The population distribution is assumed to be normal.
- (a) Construct a 90% confidence interval for the population average time to complete the tax forms.
 - (b) If the firm wishes to increase its level of confidence to 99% and keep the length of the confidence interval at least 2 by taking another survey, what changes should it make?
 - (c) If the standard deviation is not known and the sample standard deviation is 7.1 hours what will be the 90% upper confidence bound for the population standard deviation?

5. A consumer products company is formulating a new shampoo and is interested in higher foam height (in millimeters). The company wants to perform a statistical test. Foam height is approximately normally distributed and has a standard deviation of 20 millimeters. The average foam height of the current shampoo is 175 millimeters.
- (a) Establish the hypothesis.
 - (b) The sample data of 10 samples result in an average of 185 millimeters. Conclude the test if $\alpha = 0.05$.
 - (c) Calculate the p-value for the sample data of b).
 - (d) What is the probability of type II error if the true mean foam height is 195 millimeters?

Table of the Standard Normal Distribution N(0,1)
